

Make the invisible... VISIBLE!

Ampcontrol introduces the specialist, clear reflective system, for identifying your valuable cable assets in the dark!

Crystal Coat®, is a formulated coating technology to create a highly reflective surface that captures, intensifies and reflects light back to the source.

Example;

- Shuttlecar running underground and about to catch a low hanging cable – Surface reflects back alerting the driver of the dangerous situation
- Dragline/Shovel cable across an area about to be accessed by mine vehicle at night – Headlights reflect back to operator to avoid the cable and hence damage

Crystal Coat® paint has a fast drying time and can be applied during a cable workshop inspection or repair.

It's use is not limited to just cables, anything that can be painted, can be Crystal Coated!

The paint can be applied to any surface, able to be painted, creating a reflective surface on that piece of equipment.

Reflective painted cable benefits

- Illuminated cables reduce potential hazards in the workplace, increasing workplace safety
- Increase employee safety by increased cable visibility in all low light situations
- Decrease cable damages when a cable can be 'seen in the dark'!
